

IN THE UNITED STATES DISTRICT COURT  
FOR THE SOUTHERN DISTRICT OF TEXAS  
CORPUS CHRISTI DIVISION

TOMMY BRANTON,  
DARRYL FONTENOT,  
DONALD FONTENOT,  
BILLY GRAHAM,  
RONALD W. PENTON and  
MILLARD A. SHERMAN,  
Plaintiffs

United States District Court  
Southern District of Texas  
FILED

OCT 21 1999

MICHAEL N. MILROY CLERK

C.A. NO. C-98-585

VS

CITGO PETROLEUM CORPORATION  
CITGO PETROLEUM, CITGO  
REFINING AND CHEMICALS, INC.,  
AND AL PREBULA

**PLAINTIFFS' RESPONSE TO MARCO KALTOFEN'S  
MOTION TO QUASH AND MOTION FOR PROTECTIVE ORDER**

TO THE HONORABLE JUDGE OF SAID COURT:

NOW COMES TOMMY BRANTON, *et al.*, and files this their response to Movant's motion to quash and for protective order, and would respectfully show the Court as follows:

1. Contrary to Movant's allegations, Movant's data and opinions form the very core of the opinions expressed by William Sawyer, Ph.D. As demonstrated in the chart attached hereto as "Exhibit A", Dr. Sawyer relied on Mr. Kaltofen's opinions and data for such basic facts as the amount of HF released during the event, on and offsite analytical testing, damage to vegetation, and the significance of the "etching" of car windshields both on and offsite.

In sum, Dr. Sawyer's deposition is replete with references to the data and opinions of Movant, and the data and opinions expressed by Movant go to the very essence of Dr. Sawyer's opinions and are thus essential.

2. Plaintiffs have no issue with the rescheduling of the date and time of Mr.

Kaltofen's deposition, but would oppose the granting of a protective order which would prohibit Defendants from ever taking Mr. Kaltofen's deposition relative to the data and opinions which he discussed with Dr. Sawyer and which formed the basis of the opinions of Dr. Sawyer's conclusions in the *Branton* case.

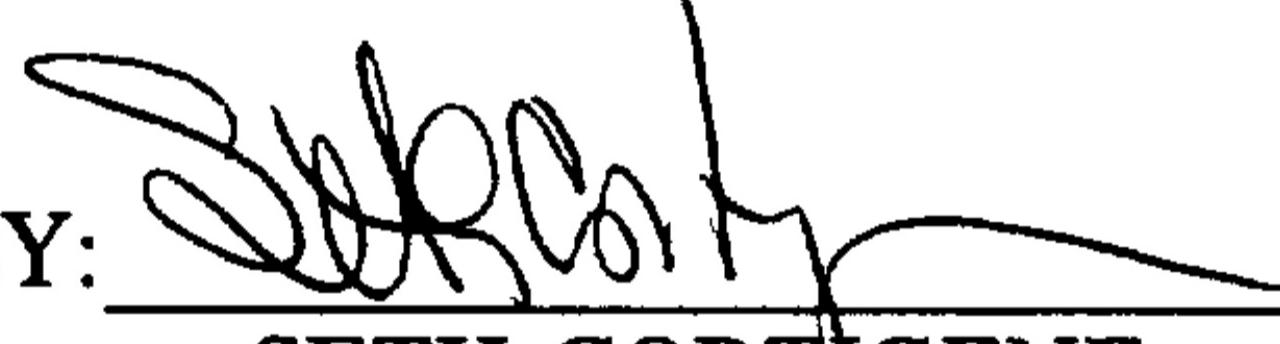

Plaintiffs have offered to compensate Mr. Kaltofen for his time spent in this additional effort, and the attached excerpts from Dr. Sawyer's deposition attached hereto as the appendix to "Exhibit A" clearly demonstrate a substantial need for Movant's data and opinions.

WHEREFORE, PREMISES CONSIDERED, Plaintiffs request that this Court DENY Movant's request for a protective order.

Respectfully submitted,

**THE CORTIGENE LAW FIRM**

**Summary of Dr. Sawyer's Deposition Testimony  
In Which Movant's Data or Opinions  
Formed the Basis of  
Dr. Sawyer's Opinions or Conclusions**

Subject	Page
Quantity of HF Release	9, 26
Reliance on Movant for exposure levels in Dr. Sawyer's report	78, 91
on-site analytical testing	11, 12
off-site analytical testing	12, 13, 121
Measurements of HF on cars outside CITGO property fenceline	13, 14
Collection and evaluation of airborne materials	15
Reliance on Movant for HF reaction to extreme heat	42, 43
Movant's discussion of AMOCO study	89, 100
Reliance on Movant for rupture site, size and duration	97, 98, 99
Basis of opinion regarding glass etching	95
Basis of opinion regarding etching as an indicator of concentration	123, 124
Amount of HF on glass	134
Damage to vegetation	141
Chronology of work with Movant on various <i>CITGO</i> cases, i.e., since June of 1997; nature and extent of telephone and personal meetings over the past several years	10

**EXHIBIT A**

2                   IN THE UNITED STATES DISTRICT COURT  
3                   SOUTHERN DISTRICT OF TEXAS  
4                   CORPUS CHRISTI DIVISION

1 Sawyer - direct

2 that you had been a party in. Is that correct?

3 A. Yes. It was a fax requesting more  
4 information, and I, of course, immediately called  
5 your firm and volunteered my services.

6 Q. And they told you, the paralegal who  
7 did it, that it was sent to you inadvertently. Is  
8 that correct?

9 A. Right, and to destroy the fax, which I  
10 did not, because I think I have to keep everything  
11 in a federal case.

12 Q. That's fine.

13 In your report, you state that a  
14 hundred pounds of hydrogen fluoride was released.  
15 Where did you get that information?

16 On page 19, it says, "The enormous  
17 quantity of hydrogen fluoride released from the  
18 spill, in excess of a hundred pounds." Can you  
19 tell me where you got the information that a  
20 hundred pounds of hydrogen fluoride was released  
21 from the spill?

22 A. Actually, that's a gross  
23 underestimate. The information I received was  
24 through a licensed engineer, Marco Kaltofen,  
25 M-A-R-C-O, K-A-L-T-O-F-E-N.

1 Sawyer - direct

2 9:35 Q. And when did you receive that  
3 information from Mr. Kaltofen?

4 9:36 A. Sometime over the past two years or so,  
5 sometime since June, middle of June 1997.  
6 9:36 Mr. Kaltofen, as you know, was allowed on site at  
7 CITGO and toured the facility shortly after the  
8 explosion and as a certified engineer has made  
9 some assessments with respect to the release,  
10 which have included on-site and off-site  
11 analytical testing in addition to a review of the  
12 various data.

13 36 Q. Do you have the information that you  
14 received from Mr. Kaltofen?

15 9:36 A. I've not received any printed  
16 information from Mr. Kaltofen.

17 9:36 Q. So how did you receive this estimate of  
18 a hundred pounds from him?

19 9:37 A. In both direct personal meetings and  
20 via teleconference.

21 9:37 Q. And when did you have direct personal  
22 meetings with Mr. Kaltofen?

23 9:37 A. Many times over the past several years,  
24 as recent as yesterday.

25 9:37 Q. Can you give me a ballpark as to how

1 Sawyer - direct

9:37 2 many times?

9:37 3 A. Since the May 12, 1997 explosion?

9:37 4 Q. Yes.

9:37 5 A. Specifically dealing with this matter  
9:37 6 or other environmental issues?

9:37 7 Q. I'm asking about the direct personal  
9:37 8 meetings you've had where you discussed the  
9:37 9 estimate of release relating to this explosion.

9:38 10 A. Via telephone conference or direct  
9:38 11 meeting?

9:38 12 Q. The direct meetings.

38 13 A. I believe we met in person discussing  
9:38 14 this matter probably twice, maybe more. And we've  
9:38 15 had numerous phone calls.

9:38 16 Q. What on-site analytical testing has he  
9:38 17 told you about?

9:38 18 A. Well, Mr. Kaltofen has tested pyrolysis  
9:38 19 products, that is, burn waste for both particulate  
9:39 20 analyses, by specialized microscopic techniques,  
9:39 21 heavy metal analyses, chlorinated dibenzo-p-dioxin  
9:39 22 and dibenzofuran analyses by high-resolution GC  
9:39 23 mass spectrometry, hydrogen fluoride analyses, pH  
9:39 24 analyses, and other specialized tests.

9:39 25 Q. Do you know what those other

1 Sawyer - direct

2 specialized tests are?

3 A. Yes, polynuclear aromatic hydrocarbons  
4 via method 8270 GC mass spectrometry and  
5 phthalates.

6 Q. Now, are all these analyses on site?

7 Because I had asked my question about on-site  
8 analyses. I was about to ask them about off site,  
9 but let me make sure that these -- what you've  
10 just described to me are just on site.

11 A. It is my recollection that all of those  
12 tests were performed on site, although I can't  
13 offhand recall the data for phthalate analyses on  
14 site. I believe they were performed.

15 Q. Did you ask Mr. Kaltofen for copies of  
16 the test results?

17 A. Yes. In fact, I met with him  
18 yesterday, and he is performing some additional  
19 tests on nickel, I believe, at this stage and will  
20 soon be compiling all of his data.

21 Q. Okay. Is there any off-site analytical  
22 testing that Mr. Kaltofen has talked to you about  
23 that he's conducted?

24 A. Oh, yes.

25 Q. Can you tell me what that is?

1 Sawyer - direct

2 A. Well, for example, he measured hydrogen  
3 fluoride on off-site parked cars at levels as high  
4 as 8,000 part per million.

5 Q. At levels of what?

6 A. 8,000 part per million in areas that  
7 were outside of the CITGO property fence line.  
8 He's performed the same specialized microscopic  
9 analyses on fly ash and pyrolysis products, which  
10 he then performed analyses to determine whether or  
11 not the particulate matter matched that of the  
12 burn debris at the site of the explosion and fire,  
13 and also measured specific metals such as copper  
14 and aluminum and hydrogen fluoride and other heavy  
15 metals in the particulate fly ash.

16 He also measured off site using  
17 high-resolution GC mass spectrometry, dioxins,  
18 dibenzofurans, polynuclear aromatic hydrocarbons,  
19 phthalates and other analytes detected by USEPA  
20 method 8270.

21 MS. FALVEY: Off the record a second.

22 (A discussion takes place off the  
23 record.)

24 Q. We can go back on the record.

25 Let me make sure I've gotten it all.

1 Sawyer - direct

5:44 2 He measured hydrogen fluoride on cars outside the  
9:44 3 CITGO property fence line?

9:44 4 A. Both on hoods and glass surfaces.

9:44 5 Q. Okay.

9:44 6 A. Of cars.

9:44 7 Q. Do you know when he did this?

9:44 8 A. Yes.

9:44 9 Q. When?

9:44 10 A. Approximately June 5th to June 10th,  
9:44 11 1997.

9:44 12 Q. And then you said he conducted  
44 13 microscopic analyses on particulate matter  
9:44 14 including fly ash. Were there any other  
9:44 15 microscopic analyses that --

9:44 16 A. Let me qualify that. When I say  
9:44 17 microscopic analysis, I'm being crude in my  
9:45 18 terminology. I believe he actually used x-ray  
9:45 19 defraction or another high-resolution technique.

9:45 20 Q. Do you know what particulate matter he  
9:45 21 was testing?

9:45 22 A. Yes.

9:45 23 Q. Can you tell me what that was?

9:45 24 A. Fine material which had settled via  
9:45 25 airborne deposition.

1 Sawyer - direct

2  
5:45 2 Q. And do you know where he obtained this  
9:45 3 material that had settled from the air?

9:45 4 A. I really cannot quote the exact address  
9:45 5 for each sample; however, I can tell you that he  
9:45 6 did collect specimens on at least three sides of  
9:45 7 the CITGO facility and also performed background  
9:46 8 measurements further into the community in  
9:46 9 different directions.

9:46 10 Q. Do you know where he obtained the  
9:46 11 material that he was testing?

9:46 12 A. I don't understand your question.

46 13 Q. Well, did he take it from vacuum  
9:46 14 cleaner bags, did he take it from rooftops? Do  
9:46 15 you know where he obtained the material?

9:46 16 A. As I stated, airborne deposition off  
9:46 17 windshields, car hoods and other non-mobile  
9:46 18 surfaces, including soil samples. He may also  
9:47 19 have -- and I'm not clear on this. I believe he  
9:47 20 told me that he collected specimens of specific  
9:47 21 plants or examined specific plants that he found  
9:47 22 that did show evidence of hydrogen fluoride  
9:47 23 damage; however, I'm not real clear on his  
9:47 24 findings and did not discuss that with him. This  
9:47 25 is something I remember from early discussions in

1 Sawyer - direct

1.10 2 A. I don't know.

0:10 3 Q. Well, you didn't know it on June 16th,  
0:10 4 did you?

0:10 5 A. No.

0:10 6 Q. And June 16th is the date on your  
0:10 7 report. Is that correct?

0:10 8 A. Yes.

0:11 9 Q. What information did you have about the  
0:11 10 quantity of the release at CITGO on June 16 when  
0:11 11 you wrote your report?

0:11 12 A. Well, in discussions with Marco  
11 13 Kaltofen who had firsthand knowledge and  
0:11 14 inspection of the site, revealed to me based upon  
0:11 15 the size of the pipes and various equipment which  
0:11 16 contained hydrofluoric acid, that a sizable  
0:12 17 release had occurred, and he gave me some  
0:12 18 approximate ranges, all of which were in great  
0:12 19 excess of 100 pounds, but he has not produced  
0:12 20 anything that I'm aware of in writing or provided  
0:12 21 me any written materials with respect to the exact  
0:12 22 quantities.

0:12 23 Q. Did you have any other information  
0:12 24 about the quantity of hydrogen fluoride released  
0:12 25 other than your conversations with Marco

1 Sawyer - direct

1:17 2 molecular weight of 20.01.

1:17 3 Q. Would you agree with me that hydrogen  
1:17 4 fluoride readily dissolves in water?

1:17 5 A. Yes.

1:17 6 Q. And would you agree with me that  
1:18 7 hydrogen fluoride is not flammable?

1:18 8 A. It is not readily flammable.

1:18 9 Q. Are you relying on information that you  
1:18 10 received from NIOSH by fax just now to answer that  
1:18 11 question?

1:18 12 A. No.

1:18 13 Q. Okay. What are you referring to to  
1:18 14 answer that question?

1:18 15 A. My familiarity with the chemistry of  
1:18 16 compounds.

1:18 17 Q. Why did you say it's not readily  
1:18 18 flammable?

1:18 19 A. Under extreme heat conditions,  
1:18 20 reactions that occur, typically the fluorine can  
1:19 21 serve as a catalyst in chemical reactions and can  
1:19 22 often be consumed into the reaction or simply  
1:19 23 serve as the catalyst, but, nonetheless, it is not  
1:19 24 completely inert.

1:19 25 Q. Can you cite any literature that

1 Sawyer - direct

1:19 2 discusses what happens to hydrogen fluoride in an  
1:19 3 extreme heat reaction?

1:19 4 A. No, I rely on Marco Kaltofen, the  
1:19 5 chemical engineer, to provide any information with  
1:19 6 respect to those issues.

1:20 7 Q. Is it your opinion that the five  
1:20 8 plaintiffs in this action were exposed to fluorine  
1:20 9 gas?

1:20 10 A. They were exposed to a combination of  
1:20 11 hydrogen fluoride and fluorine gas.

1:20 12 Q. Why is it that you believe that they  
20 13 were exposed to fluorine gas?

1:20 14 A. Because of the very high conversion of  
1:20 15 hydrogen fluoride to fluorine under conditions of  
1:20 16 high water, high humidity, and high temperature.

1:21 17 Q. And have you relied upon any literature  
1:21 18 to demonstrate that fluorine gas would be created  
1:21 19 under these high water, high humidity conditions?

1:21 20 A. I've relied primarily on discussions  
1:21 21 with Marco Kaltofen, but I also do have in my file  
1:21 22 a notation of conversion of hydrogen fluoride to  
1:21 23 fluorine in peer-reviewed studies.

1:21 24 Q. Can you tell me what study you're  
1:21 25 referring to, what studies you're referring to?

1 Sawyer - direct

5:39 2 Q. Okay. The report which we have marked  
3:39 3 as an exhibit to your deposition, does it refer in  
3:39 4 any way to the work that's being done by Kaltufen?

3:39 5 A. Does my report refer to Kaltufen's  
3:39 6 work?

3:39 7 Q. Right.

3:39 8 A. I'll take a look. I was asleep at the  
3:39 9 wheel when I wrote this, so I don't remember. I  
3:43 10 really had to work hard to get this out in time.

3:43 11 All right. You want to know if I rely  
3:43 12 on Marco Kaltufen's testing or assessment in the  
43 13 production of this report. Is that correct?

3:43 14 Q. I want to know if the report states  
3:43 15 that you relied upon Marco Kaltufen, and I'll ask  
3:43 16 you the next question next.

3:43 17 A. No, it doesn't state that, no.

3:43 18 Q. Okay. Did you rely on information you  
3:43 19 had received from Marco Kaltufen in coming up with  
3:43 20 what you say the exposures might have been in this  
3:43 21 report?

3:43 22 A. Yes.

3:43 23 Q. Yes?

3:43 24 A. Yes, I did.

3:44 25 Q. Okay. Before the break, I asked you if

1 Sawyer - direct  
5:56 2 Other documents indicate they were worn throughout  
3:56 3 the event. There seems to be some conflicts among  
3:56 4 the reports, and it appears that the RTFC reports  
3:56 5 indicate that some of the equipment was on  
3:56 6 stand-by, where a later document with a summary  
3:56 7 report written by a CITGO captain or RTFC captain  
3:56 8 refers that all of the men had full turnout gear  
3:56 9 and SCBA respirators on throughout the event. But  
3:56 10 to really specifically address your question about  
3:56 11 the higher level exposure, the folder that we just  
3:56 12 marked as Exhibit 7, that does reveal systemic  
57 13 poisoning in a very short order of time, which is  
3:57 14 consistent with IDLH levels of exposure.

15 (File Folder entitled, "CITGO Refinery  
16 Exposure RTFC Injury Illness," is received and  
17 marked Sawyer-7 for identification.)

3:57 18 Q. Is there any other information upon  
3:57 19 which you relied to support your opinion that the  
3:57 20 exposures after the CITGO May 12th event were  
3:57 21 greater than those involved in the Texas City  
3:57 22 event?

3:57 23 A. Not at this time, although I am  
3:57 24 awaiting analyses from Marco Kaltofen with respect  
3:57 25 to the off-site hydrogen fluoride levels which may

1 Sawyer - direct

4:09 2 rely for that statement?

4:09 3 A. On several pieces of data: the physical  
4:09 4 chemical properties of the gas, studies reported  
4:09 5 by the -- as conveyed to me through Marco Kaltofen  
4:09 6 in a non-peer reviewed study of a test site  
4:09 7 sponsored by Amoco in which approximately 5,000  
4:09 8 pounds of hydrogen fluoride were released into a  
4:09 9 southwestern United States desert and tracked.

4:10 10 The -- of course, the CITGO instructive safety  
4:10 11 training video which indicates that the  
4:10 12 hydrogen fluoride gas is heavier than air and  
10 13 initially go up with heat and come down to  
4:10 14 grade level. This is a very true statement that  
4:10 15 was -- is on the videotape, characteristic of  
4:10 16 this material. And also the review of the  
4:10 17 photographs and video.

4:10 18 Q. I know we have the videos here that  
4:10 19 you've reviewed. Do we have the photographs that  
4:10 20 you've reviewed?

4:10 21 A. Yes.

4:10 22 Q. Where are they? Why don't we mark  
4:11 23 those as Sawyer Exhibit 8?

4:11 24 And from whom did you receive these  
4:11 25 photographs? Was it Mr. Terry again?

1 Sawyer - direct

4:13 2 and blew out of the northwest, west or southwest,  
4:13 3 there was significant exposure, and at this stage  
4:13 4 the only evidence I have of that exposure is the  
4:13 5 medical records indicating toxicological effects  
4:13 6 were occurring at a level exceeding the threshold  
4:13 7 limit value of roughly 3 part per million.

4:14 8 However, I hope to supplement that data with the  
4:14 9 work being performed by Marco Kaltofen.

4:14 10 Q. Let me ask you one thing going back  
4:14 11 to -- I had asked you about supportive evidence on  
4:14 12 the comparison between the CITGO Corpus Christi  
14 13 event and the Texas City event, and you referenced  
4:14 14 Exhibit 7, which was the evidence, to use your  
4:14 15 term, of the systemic poisoning of the RTFC fire  
4:14 16 fighters. Are those the fire fighters whose blood  
4:14 17 was tested?

4:14 18 A. No.

4:15 19 Q. Okay. Do you use the words "dose" and  
4:15 20 "exposure" to mean two different things?

4:15 21 A. Yes.

4:15 22 Q. And what does the word "exposure" mean  
4:15 23 to you?

4:15 24 A. It means that I could dose a person or  
4:15 25 an animal with metallic mercury, a gram of it, and

1 Sawyer - direct

4:22 2 administration building?

4:22 3 A. No. I am hoping to obtain that data in  
4:22 4 the near future.

4:22 5 Q. Now, do you have any evidence of  
4:22 6 etching during this first 15 minutes of the  
4:22 7 explosion?

4:23 8 A. Yes.

4:23 9 Q. What evidence of etching do you have  
4:23 10 during the first 15 minutes of the explosion?

4:23 11 A. The listing of damaged equipment by the  
4:23 12 RTFC.

23 13 Q. Now --

4:23 14 A. And applying the basic scientific  
4:23 15 principle as conveyed to me by the chemical  
4:23 16 engineer, Marco Kaltofen, that the hydrogen  
4:23 17 fluoride being under high pressure would have  
4:23 18 resulted in the -- in an initial escape of the  
4:23 19 material early on in the explosion, at which time  
4:23 20 the exposure would have been at its peak, peak  
4:23 21 level.

4:23 22 Q. Do you know what time the RTFC  
4:24 23 emergency equipment arrived on the scene?

4:24 24 A. Yes.

4:24 25 Q. What time did it arrive on the scene?

1 Sawyer - direct

2 fighting effort?

4 :26 3 A. The engineering principle that  
4 :26 4 high-pressure gas upon breakage immediately  
4 :26 5 releases, and then following that immediate bolus  
4 :27 6 release, a continuing stream flows from the  
4 :27 7 storage tanks and other safety valves, pop-off  
4 :27 8 valves and other equipment. It's really an  
4 :27 9 engineering issue, but I can only rely on what  
4 :27 10 I've been told.

4 :27 11 Q. And that is what you've been told by  
4 :27 12 Mr. Kaltofen. Is that correct?

27 13 A. I did discuss this with him back in  
4 :27 14 1997. I believe that's what he told me.  
4 :27 15 Specifically I think he told me that he saw some  
4 :27 16 large -- either in the plans or his own  
4 :27 17 observations, some large carrier pipes, and I  
4 :27 18 believe he made a calculation, if I'm not  
4 :27 19 mistaken, of so many gallons within those pipes  
4 :27 20 that would have immediately released, and then a  
4 :27 21 sustained release from other devices followed  
4 :27 22 that.

4 :27 23 Q. Do you personally, as opposed to  
4 :27 24 Mr. Kaltofen, have any information about the size  
4 :28 25 of the rupture which caused the accident?

1 Sawyer - direct

4:28 2 A. No.

4:28 3 Q. And do you have any information about  
4:28 4 how the size of the rupture that caused the event  
4:28 5 might have changed over the course of the event?

4:28 6 A. No.

4:28 7 Q. Do you know what pipe it is that  
4:28 8 ruptured?

4:28 9 A. No. I was told, but I don't remember  
4:28 10 the detail on that.

4:28 11 Q. And do you know how much hydrofluoric  
4:28 12 acid was contained in the streams where the  
28 13 rupture occurred?

4:28 14 A. In the pipes and assemblies that were  
4:28 15 carrying it at the site of the rupture?

4:28 16 Q. Right.

4:28 17 A. I was given that number. I believe  
4:28 18 Marco gave me that number in 1997. I don't recall  
4:28 19 it.

4:28 20 Q. Okay. Do you have any documents  
4:28 21 yourself that would show you what that number is?

4:29 22 A. No. I do have documents that show  
4:29 23 schematics of that pipe work, and it's really  
4:29 24 beyond my expertise to address that.

4:29 25 Q. Okay. So you are relying on

1 Sawyer - direct

1:29 2 Mr. Kaltofen for your -- for the basis of your  
4:29 3 opinion that the immediate release caused etching  
4:29 4 to the equipment as it arrived?

4:29 5 A. No, I'm relying on Mr. Kaltofen's  
4:29 6 experience and expert opinion as a chemical  
4:29 7 engineer that there was a sizeable release at the  
4:29 8 time of the explosion and fire, and that release  
4:30 9 continued throughout a considerable length of  
4:30 10 time.

4:30 11 Q. Do you have any information about the  
4:30 12 amount of water that was applied to the fire?

30 13 A. I did read in some of the CITGO or RTFC  
4:30 14 records that monitors were applied, foam was  
4:30 15 applied, and there are even some statistics in  
4:30 16 there as to how much they had to replenish with  
4:30 17 respect to the foam. I don't recall those numbers  
4:30 18 precisely.

4:30 19 Q. And have you been provided with the  
4:30 20 information about the amount of fluorides in the  
4:30 21 wastewater treatment flows after the event?

4:30 22 A. No. However, I wouldn't expect much.  
4:31 23 The study by Amoco sponsored by a research  
4:31 24 laboratory in the southwest desert revealed that,  
4:31 25 I think, 5,000 pounds of hydrogen fluoride was

1 Sawyer - direct  
1  
4:31 2 suddenly released into the air with large surface  
4:31 3 areas of drain pans underneath it to catch it.  
4:31 4 The drain pans remained dry because it all  
4:31 5 volatilized into the air. I don't believe from a  
4:31 6 physical chemistry standpoint that a large portion  
4:31 7 of this material would have gone down the storm  
4:31 8 sewer. I think the majority of it went into the  
4:31 9 air, especially in light of the outdoor  
4:31 10 temperature being above the boiling point of the  
4:32 11 material itself and the heat of the fire.

4:32 12 Q. Do you have a copy of the study by  
32 13 Amoco with you today?

4:32 14 A. No. I said I relied on Marco  
4:32 15 Kaltofen's knowledge of that study. In fact, he  
4:32 16 made some direct phone calls to personnel who  
4:32 17 sponsored that study, and I have, as I already  
4:32 18 stated, a non-peer reviewed summary of that test.  
4:32 19 I have that with me, but I deem it unreliable, as  
4:32 20 it is not peer reviewed.

4:33 21 Q. Have you reviewed any other literature  
4:33 22 about the use of water to contain exposures to  
4:33 23 hydrogen fluoride after an accidental release at a  
4:33 24 refinery?

4:33 25 A. Well, I'm familiar with the principle.

1 Sawyer - direct

5:15 2 Q. Is it your opinion that CITGO should  
3 have had better equipment for Mr. Sasara?

5:15 4 A. Absolutely. It's outrageous that one  
5 would station a tank of extremely toxic hydrogen  
6 fluoride in such close proximity to a large city  
7 and populated area without having calibrated  
8 active monitors and an evacuation plan linked with  
9 those monitors and the fire department and police  
10 department with appropriate warnings immediately  
11 conveyed to the first responders.

5:15 12 Q. Do you know whether there was any  
13 etching at or near this location?

5:15 14 A. What location?

5:15 15 Q. The West Saxton address.

5:15 16 A. Yes, there was. There was significant  
17 etching at that location.

5:16 18 Q. And how do you know that?

5:16 19 A. Yesterday, I met with Marco Kaltofen,  
20 and he went through his data with me, and it was  
21 very enlightening data with respect to the  
22 concentrations, the quantity, location and the  
23 etchings off site.

5:16 24 Q. And can you tell me what he told you  
25 about off-site etching yesterday?

1 Sawyer - direct

5:17 2 been etched after the CITGO event?

5:17 3 A. No.

5:17 4 Q. And on what methods did he determine

5:18 5 that the glass was etched? Did he explain that to  
6 you?

5:18 7 A. Vaguely. He used a -- may have been  
5:18 8 x-ray defraction microscopy method. I forgot.

5:18 9 Q. And what glass was it that he tested  
5:18 10 for etching?

5:18 11 A. I'm not certain. Multiple samples.

5:18 12 Q. And do you know when he tested it for  
18 13 etching?

5:18 14 A. I believe upon his first visit to the  
5:18 15 site in June of '97.

5:18 16 Q. Do you know whether he tested any of  
5:18 17 the RTFC equipment that was replaced?

5:18 18 A. I don't know.

5:19 19 Q. And did he tell you anything about the  
5:19 20 frequency of etching south of the facility?

5:19 21 A. No.

5:19 22 Q. Now, in your report, I believe you  
5:19 23 indicate that glass would be etched in six to  
F 19 24 seven hours at levels in the 5 to 100 part per  
5:19 25 million range.

1 Sawyer - direct

5:19 2 A. Yes.

5:19 3 Q. On what do you base that opinion?

5:19 4 A. Well, primarily the reference that was  
5:20 5 in the CITGO medical literature file and the paper  
5:20 6 published by Wing which I referred to earlier,  
5:20 7 page 156, the top of the page, right column.

5:20 8 Q. Anything else?

5:20 9 A. Discussions with Marco Kaltufen.

5:21 10 Q. Are you aware of any literature that  
5:21 11 suggests that glass can be etched at levels much  
5:21 12 lower than 5 to 100 parts per million?

21 13 A. I am familiar with that occurring over  
5:21 14 a long duration of exposure or with actual aqueous  
5:21 15 immersions, that is, where pieces are immersed  
5:21 16 into a liquid as opposed to just being exposed to  
5:21 17 the air.

5:21 18 Q. Now, is it your opinion that the  
5:21 19 etching to the RTFC vehicles was caused by  
5:21 20 exposure to the air?

5:22 21 A. A mixture. There were some pieces of  
5:22 22 equipment based on my review of the RTFC reports  
5:22 23 that were in close proximity to the fire, other  
5:22 24 pieces that were set back a long distance.

5:22 25 Q. And the equipment that was in close

1 Sawyer - direct

2 A. No.

3 Q. You obtained it from Mr. Terry?

4 A. Yes.

5 Q. Okay. Is there any difference in glass  
6 etching depending on the amount of concentration  
7 of the exposure of the glass to hydrogen fluoride?

8 A. I don't know.

9 Q. Does fluorine etch glass?

10 A. I'm not sure.

11 Q. Has Mr. Kaltofen told you that he's  
12 been able through his testing to determine the  
13 amount of hydrogen fluoride on the glass?

14 A. I believe so.

15 Q. Did he describe for you how he was able  
16 to do so?

17 A. No.

18 Q. Now, I think earlier we talked about  
19 the fact that the water -- that a test result of  
20 the pH of water was at two. Is that correct?

21 A. I think at two locations it was at two  
22 and three.

23 Q. What does that tell you?

24 A. Well, it tells me that the  
25 concentration of hydrogen fluoride, that is, the

1 Sawyer - direct

2 have on vegetation from -- strike that.

3 Are these the only photos you have of  
4 vegetation after the event?

5 A. Yes. Although I think it's possible  
6 that Marco Kaltofen has photos and samples, but  
7 I'm not sure.

8 Q. But you don't have them?

9 A. No.

10 Q. And, again, you received this  
11 information that we're marking as Sawyer Exhibit  
12 12, these photographs, from Mr. Terry?

13 A. Yes.

14 Q. Are you aware of any studies that have  
15 been done of the vegetation in the area  
16 surrounding the refinery after the event?

17 A. Only last night I learned from Attorney  
18 Cortigene that a scientist or botanist had been  
19 consulted by CITGO, I believe, who did collect  
20 some specimens and found no damage, and I was  
21 rather surprised to hear that because I believe  
22 that I recall differing results from Marco  
23 Kaltofen.

24 Q. But you don't have a copy of his  
25 written report. Is that correct?
